# **Leaf Powers**

# **Graph theoretical approach**

#### [Nishimura, Ragde and Thilikos 2000]

A graph G is the k-leaf power of a tree T if

- ightharpoonup V(G) is the set of leaves of T and
- ▶ for every  $u, v \in V(G)$ ,  $uv \in E(G) \iff \operatorname{dist}_T(u, v) \leqslant k$ .

Leaf Powers =  $\bigcup_{k \in \mathbb{N}} k$ -Leaf Powers.

2

# Graph theoretical approach

#### [Nishimura, Ragde and Thilikos 2000]

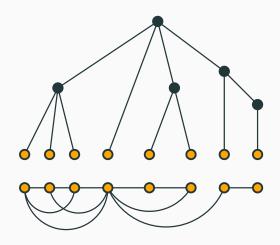

A graph G is the k-leaf power of a tree T if

- ightharpoonup V(G) is the set of leaves of T and
- ▶ for every  $u, v \in V(G)$ ,  $uv \in E(G) \iff \mathsf{dist}_T(u, v) \leqslant k$ .

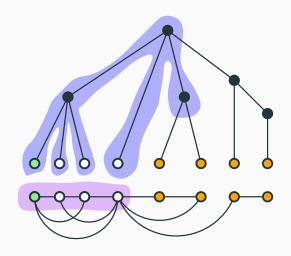

Leaf Powers =  $\bigcup_{k \in \mathbb{N}} k$ -Leaf Powers.

ightharpoonup T is called a **leaf root** of G.

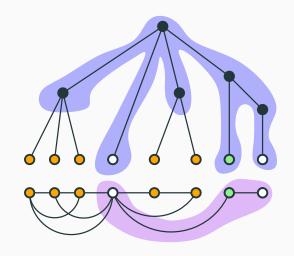

# **Example of 3-leaf power**

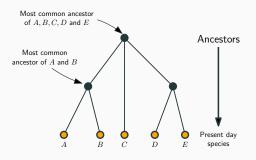

# Example of 3-leaf power

# **Example of 3-leaf power**

# **Phylogenetics**

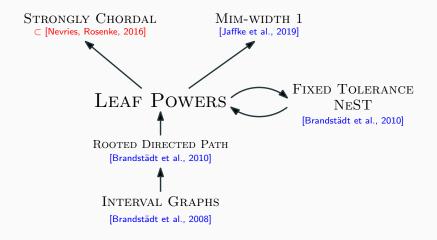

# Classical phylogeny problem

- ▶ Input: phylogenetic distance matrix D of a set X of organisms.
- ▶ Output: a **tree** T with set of **leaves** X such that, for every  $x, y \in X$ , the distance between x, y in T is **close to** D[x, y].

# Recognition of k-leaf power

# Open question

Can we recognize k-leaf powers in polynomial time?

$Value \; of \; k$	Polynomial Time Algorithms
2	Trivial: disjoint union of cliques
3	[Nishimura, Ragde, Thilikos, 2000] [Brandstädt, Le, 2006]
4	[Nishimura, Ragde, Thilikos, 2000] [Brandstädt, Le, Sritharan, 2006]
5	[Chang, Ko, 2007]
6	[Ducoffe, 2019]

# **Parameterized Complexity**

#### [Eppstein and Havvaei, IPEC 2018]

k-leaf powers of bounded degeneracy are recognizable in FPT time  $(O(f(k) \cdot n^{O(1)}))$ .

#### [Lafond, SODA 2022]

**k-leaf powers** are recognizable in **XP time**  $(O(n^{f(k)}))$ .

7

# 

Leaf Powers =  $\bigcup_{k \in \mathbb{N}} k$ -Leaf Powers.

## Open question

Can we recognize leaf powers in polynomial time?

It might be better to not focus on k the distance value:

- ightharpoonup Recognizing k-leaf powers might be harder than leaf powers!
- ▶ Algorithms for  $k \le 6$  does not seem to **generalize**.
- ightharpoonup XP algorithm of [Lafond, 2022] relies heavily on k.

# **Tree Structural Approach**

# Open question

Given a class C of trees. Can we recognize **leaf powers with a leaf root in** C in polynomial time?

- ▶ No distance bound allows to use alternative models.
- ► Might lead to interesting results!

# **Tree Structural Approach**

# Open question

Given a class C of trees. Can we recognize **leaf powers with a leaf root in** C in polynomial time?

- ▶ No distance bound allows to use alternative models.
- ► Might lead to interesting results!

[Brandstädt, Hundt, 2008]

Unit interval graphs are exactly leaf powers with a caterpillar leaf root.

## Our results

## **Linear Leaf Powers**

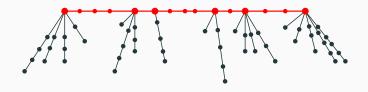

Linear leaf powers are graphs with a leaf root that is a subdivided caterpillar.

#### Our results

#### **Linear Leaf Powers**

**Linear** leaf powers are graphs with a leaf root that is a **subdivided caterpillar**.

[B., Høgemo, Telle, Vatshelle, 2022]

**Linear Leaf Powers** are equivalent to **Co-TT graphs**.

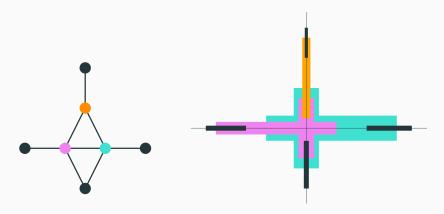

[Golovach, Heggernes, Lindzey, McConnell, Dos Santos, Spinrad, Szwarcfiter, 2014]

**Co-TT graphs** can be recognized in  $O(n^2)$  time.

10

### Our results

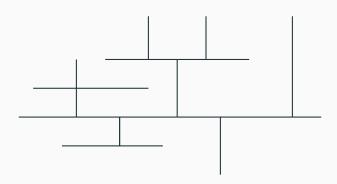

## NeS Model: intersection model for leaf powers

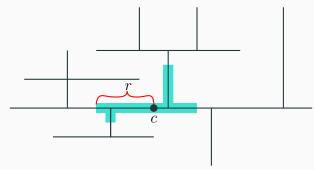

[B., Høgemo, Telle, Vatshelle, 2022]

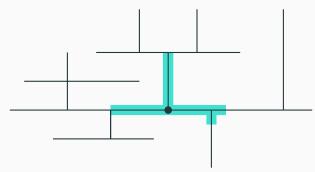

We can recognize in **polynomial time leaf powers** with a **Star NeS model**.

# Star NeS model

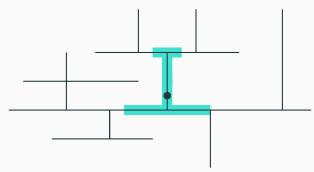

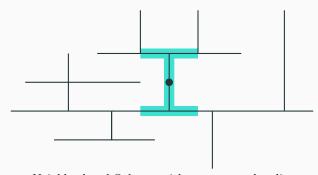

Neighborhood Subtree with center c and radius r

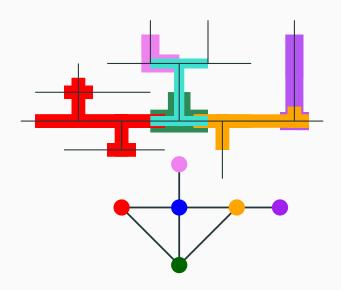

Neighborhood Subtree with center c and radius r

Neighborhood Subtree with center c and radius r

Neighborhood Subtree with center  $\boldsymbol{c}$  and radius  $\boldsymbol{r}$ 

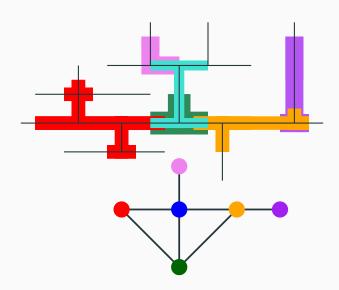

## Powerful model

[Bibelnieks, Dearing, 1993] + [Brandstädt, Hundt, Mancini, Wagner, 2010]

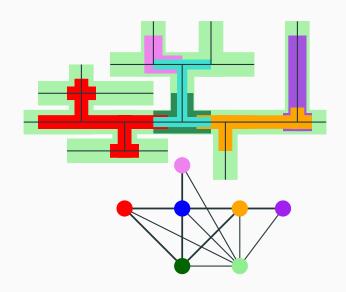

A graph is a **leaf power** iff it admits a **NeS model**.

- ► NeS models are a nice generalization of Interval models!
- Many properties on leaf powers are easy to prove thanks to NeS models.

# Adding a universal vertex

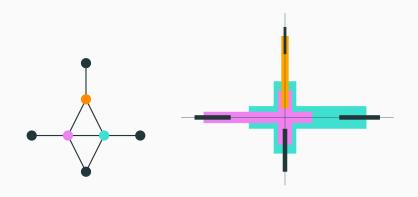

# Adding a universal vertex

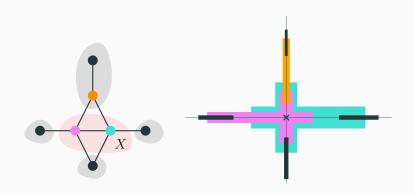

#### Star NeS model

Star NeS model: NeS model whose embedded tree is a star.

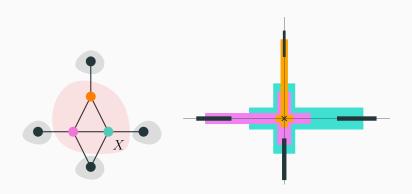

[B., Høgemo, Telle, Vatshelle, 2022]

We can recognize in polynomial time leaf powers with a Star NeS model.

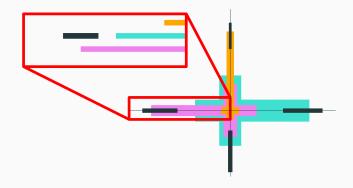

- $ightharpoonup X = \{v \in V(G) \mid c \in T_v\}$  is a clique.
- ▶ The lines of the star induces a partition  $\mathcal{B}$  of  $V(G) \setminus X$ .

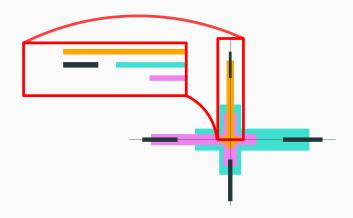

- ightharpoonup We can assume w.l.o.g. that X is a maximal clique.
- ▶ We have  $cc(G X) \sqsubseteq \mathcal{B}$ .

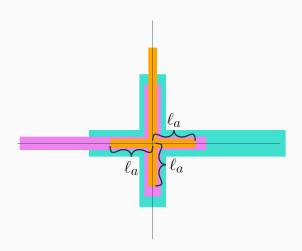

16

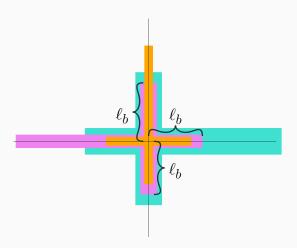

▶ For each  $B \in \mathcal{B}$ ,  $G[X \cup B]$  is an X-interval graph.

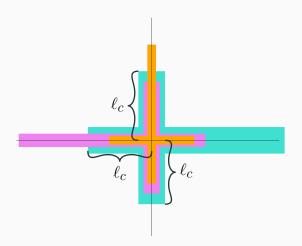

▶ For each  $B \in \mathcal{B}$ ,  $G[X \cup B]$  is an X-interval graph.

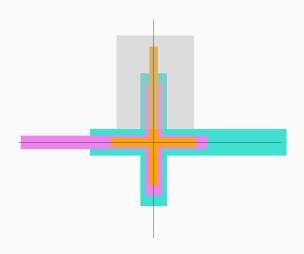

▶ There is a **natural order** on the vertices of X: a < b < c.

▶ There is a **natural order** on the vertices of X: a < b < c.

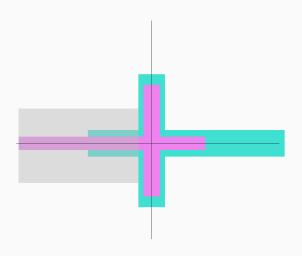

▶ There is a **natural order** on the vertices of X: a < b < c.

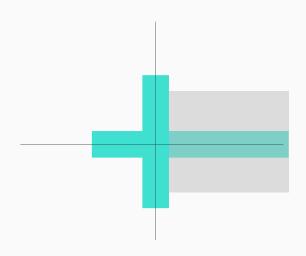

ightharpoonup a < b < c is an elimination order...

#### **Some Observations**

ightharpoonup a < b < c is an elimination order...

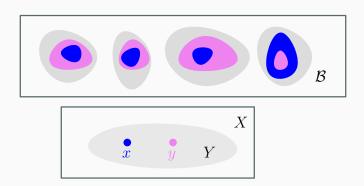

#### **Some Observations**

ightharpoonup a < b < c is an elimination order...

#### Removable vertex

x is  $\mathcal{B}$ -removable from  $Y \subseteq X$  if N(x) is not minimal in at most 1 block of  $\mathcal{B}$ .

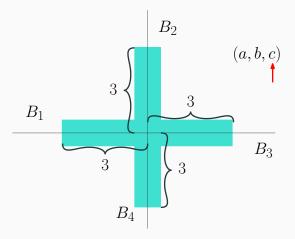

#### **Good Partition**

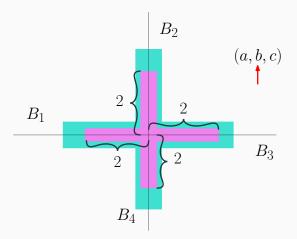

A **good partition** of a graph G is a pair  $(X, \mathcal{B})$  with:

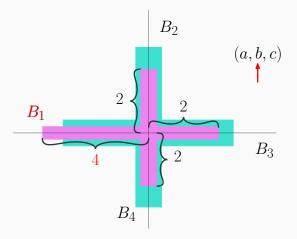

- ► X a maximal clique.
- ▶  $\mathcal{B}$  a partition of  $V(G) \setminus X$ .

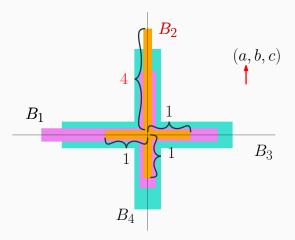

with the following properties:

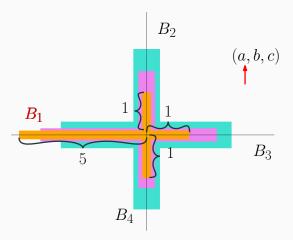

- 1.  $cc(G X) \sqsubseteq \mathcal{B}$
- 2. For each  $B \in \mathcal{B}$ ,  $G[X \cup B]$  is an X-interval graph.
- 3. There exists an elimination order  $(x_1, ..., x_t)$  of X such that  $\forall i \in [t], x_i$  is  $\mathcal{B}$ -removable from  $\{x_i, ..., x_t\}$ .

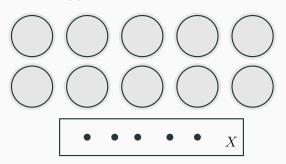

# **Algorithm**

# [B., Høgemo, Telle, Vatshelle, 2022]

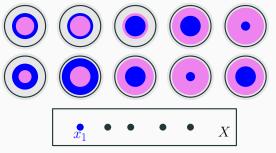

We can decide whether a graph admits a **good partition** in **polynomial time**.

- 1. Check if G is **chordal**.
- 2. For every **maximal clique** X, try to construct a good partition **greedily**.

Star with  $\mathcal{A} = \mathsf{CC}(G-X)$  and check if every  $B \in \mathcal{A}$  induces an X-interval with X.

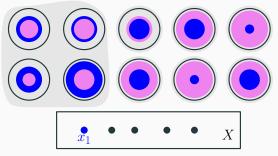

Find  $x_1 \in X$  such that  $X \cup \mathsf{notmin}(x_1, X, \mathcal{A})$  induces an X-interval.

 $x_1$  is now  $\mathcal{A}$ -removable from X

#### Merge the blocks of A in notmin $(x_1, X, A)$

 $x_1$  is now  $\mathcal{A}$ -removable from X

Find  $x_2 \in Y$  such that  $X \cup \mathsf{notmin}(x_2, Y, \mathcal{A})$  induces an X-interval.

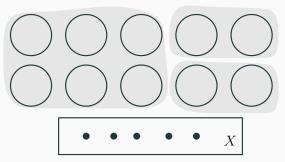

# Merge the blocks of $\mathcal{A}$ in $\mathsf{notmin}(x_2, Y, \mathcal{A})$

 $x_2$  is now  ${\mathcal A}$ -removable from Y

When  $Y = \emptyset$ , we return (X, A).

 $(x_1, x_2, \dots, x_t)$  is an elimination order!  $x_i$  is  $\mathcal{A}$ -removable from  $\{x_i, x_{i+1}, \dots, x_t\}$ .

# [B., Høgemo, Telle, Vatshelle, 2022]

▶ If the algo. returns a pair (X, A), then it is a **good partition**.

- ▶ If the algo. returns a pair (X, A), then it is a **good partition**.
- ▶ If there exists a **good partition**, then the algo. returns one.

- ▶ If the algo. returns a pair (X, A), then it is a **good partition**.
- ▶ If there exists a **good partition**, then the algo. returns one.
  - ▶ If the algo. follows an **elimination order**  $(x_1, ..., x_t)$  of some good partition, then it returns a **good partition**.

- ▶ If the algo. returns a pair (X, A), then it is a **good partition**.
- ▶ If there exists a **good partition**, then the algo. returns one.
  - ▶ If the algo. follows an **elimination order**  $(x_1, ..., x_t)$  of some good partition, then it returns a **good partition**.
  - ▶ (Crux) If the algo. stops following  $(x_1, ..., x_t)$ , then it follows the elimination order of another good partition.

- ▶ If the algo. returns a pair (X, A), then it is a **good partition**.
- ▶ If there exists a **good partition**, then the algo. returns one.
  - ▶ If the algo. follows an **elimination order**  $(x_1, ..., x_t)$  of some good partition, then it returns a **good partition**.
  - ▶ (Crux) If the algo. stops following  $(x_1, ..., x_t)$ , then it follows the elimination order of another good partition.
- ► Everything can be done in **polynomial time**.

# Conclusion

We can recognize in polynomial time linear leaf powers and leaf powers with a Star NeS model.

- ► Can we recognize **leaf powers** in polynomial time?
- ► Continue the **tree structural approach!** 
  - ► Embedded tree with **two internal nodes**.
  - ► Vertices with **non-trivial subtrees** induce a **clique**.

We can recognize in polynomial time linear leaf powers and leaf powers with a Star NeS model.

- ► Can we recognize **leaf powers** in polynomial time?
- Continue the tree structural approach!
  - ► Embedded tree with **two internal nodes**.
  - ► Vertices with **non-trivial subtrees** induce a **clique**.

▶ Leaf-Rank(G) = min{ $k \in \mathbb{N} \mid G$  is a k-leaf power }.

#### Conjecture

For every leaf power G, we have Leaf-Rank $(G) \leq n^{O(1)}$ .

# Thank you
